# **Electromagnetic flowmeter type PEM-500**

- ✓ Nominal sice: DN 10...300 (ANSI 0,5...12")
- ✓ Maximum static pressure 1,6 MPa, 2,5 MPa or 4 MPa
- ✓ Accuracy 0,5%

PLISEN

- ✓ Output signal 4 ÷ 20 mA, pulse output or frequecy output
- Communication interface Modbus RTU / RS485

#### Application and construction

Electromagnetic flowmeter type PEM-500 is applicable to the measurement of flow of the liquids with minimum conductivity of 5éS/cm. Device measures flow and volume of liquids in both directions of flow. For correct measurement pipe of sensor has to be fully filled by liquid.

Sensor doesn't have any mechanical parts inside flow tube which ensure undisturbed flow of medium. Flowmeter is able to measure flow of medium like pure liquids but also pastes and chemically aggressive liquids.

It's applicable is in water treatment facilities for flow measure of water and wastewater, chemical industry, food industry or heat plants. Compact construction with ingress protection rating IP68 (special version) allows to bury device underground.

Sensors and control unit of electromagnetic flowmeter PEM-500 can't be disconnected by user.

The casing of the control unit is made of aluminium alloy cast. User has no access to the electronic boards. Electrical connection of flowmeter is provided by the factory assembled cables. Wires in cables are marked by colours or numbers (detailed description available in table). Number of cable depends on version of power supply. Version with power supply 90...260 VAC is equipped with two separate cables – signal cable and power supply cable. Version with power supply 10...36 VDC is equipped with one

signal-supply cable. In standard flowmeter is equipped with 3m long cables. Other cable length are available on request. As an option PEM-500 flowmeter can be delivered with junction box PP-PEM with ingress protection class IP67 with factory connected flowmeter's cable which allows users connecting cables to terminals.

Flowsensor tube have flanges (which allows to mount sensor in pipeline), inner electrodes and isolating pipe lining (both matched to measured medium). Electrodes in standard are made of stainless steel but as option user can choose other materials appropriate for chemical characteristic of measured medium.

#### Configuration and communication

Configuration and communication is handled by interface RS485 and Modbus RTU protocol. User can communicate with PEM-500 flowmeter by using PC computer with RS-485/USB converter and software RAPORT 2 or any other software which can refer to registers described in interface's documentation.

User have possibility of programing for example: empty pipe detection, low flow detection, alarms or registering of measured values or events. For visual indication of measurement user can use HMI panels working as Modbus master device.

## Dimensions of sensor

<u> PLISEN</u>

DN 10 - DN 150 A ± 5 mm, DN 200 - DN 300 A ± 10 mm

# **Recommendations regarding installation**

### Choosing of size and measuring range of flowmeter

Choosing the most suitable diameter of senor tube depends on diameter of pipeline where flowmeter will be installed but also on value of flow of liquid in this pipeline. Minimal measuring range for flowmeter corresponds to flow speed 0,3 m/s and maximum measuring range corresponds to flow speed 10 m/s. Optimal and recommended values of measuring ranges correspond with flow speed in range from 2 to 3, 5m/s. Factory setting of measuring ranges considering optimal flow speeds are indicated in below table.

Factory calibration of flowmeters is performed with flow speed 6 m/s. Results of calibration are shown on calibration certificate supplied together with flowmeter.

Flow speed should also consider physical properties of measured liquid. For erosive mediums like water with sand or limewater flow speed below 2 m/s is recommended. Sedimentary liquids like sewage sludge flow speed should be higher than 2 m/s.

Measurement of flow for linear flow speed less than 0,1m/s is not recommended.

Flow value
